We need your help to maintenance and improve this website. I bought these new parts It will do this indefinitely. But here is the kicker when i first put the pieces together and hit the power button, the comp booted up just fine, 3 times. Well i decided to power it down because i had to download linux to put it on a usb stick so i could install it on the new box which doesnt have a cdrom at all. Well when i finally had my usb stick ready to go, i plug the computer in, and thats when the problems started happening. But here is a curve ball, when i put in 2 sticks of 512 Corsair pc5400 ram, the computer will power up but will not POST, so in other words with this ram it will have enough power to stay on, get the hdd going and the fans, but it will never POST. Now i went ahead and tried it with just one stick of the OCZ ram and it does the same thing, it will power up but will never POST. With every other stick i tried, it powers up enough to get the fans spinning and then after about 12 seconds it automatically shuts off and powers up again. I got 3 different types of memory sticks, and it will only power up and no post with either 1 OCZ stick or the two corsair sticks. Has anyone every experience anything like this before. Is really wierd that with some memory it will actually power up completely, im talking about hdd and fans, but no POST. But what gets me even more is that, im using the same ram that i used when it first booted up the first couple of times, and now nothing. Im really to just called it a dead mobo. I just hate the wait of sending it in and getting back, i been trying to build this thing for the last 2 months, and now that i have finally got all the pieces, it doesnt even boot.

[bizwd.com/wp-content/plugins/formcraft/file-upload/server/content/files/1626feb085c2ad---bose-wave-music-system-manual-pdf.pdf](http://bizwd.com/wp-content/plugins/formcraft/file-upload/server/content/files/1626feb085c2ad---bose-wave-music-system-manual-pdf.pdf)

Have you tested your PSU on another machine. Any time I have experienced this in the past, it has either been PSU or motherboard as long as I can verify that the RAM works properly in another machine. All the ram works great, and when i plugged the other PSU into this machine, it did exactly the same thing. Thanks for the replys i already contacted newegg and packaged the board and is ready to be sent back. Im also sending back the ram because i left it in my other machine, and let memtest86 run over night, and it found multiple errors. Oh well, like i said guys thanks for the replys, im not going to waste anymore time with it. Also i checked and make sure the voltage on the ram was good the first time, when the thing actually powered up. 300W should be plenty for this thing, it has onboard memory, a c2d 7200 cpu which is 65W and it wouldnt even power up with the

hdd disconnected. Remember, the funny thing about this is, it will get power if i use 1 stick of the ocz ram, and by that i mean one specific stick, the other one wont work, even tho they both have the same timings and use the same voltage. Therefore i cant get into the bios to check how much memory the video chip is using Try checking the copper bindings and the motherboard surface for such a possibility It is meant as an HTPC and im building it little by little, so i have been buying the pieces kind of one by one. It wont power up with or without the hdd plugged in. Im usually pretty good at isolating problems when it comes to building computers, but for some reason im just having alot of trouble with this one. The PSU is the most important component of a Rig, so you might want to upgrade to a quality one in the future. I was afraid the board was DOA, and i wasnt too sure it was because like i said before, it powered up the first 2 or 3 times and i got up to the BIOS. You changed everything out.

Now i thought about that alot, and the chances have to be pretty slim, but nevertheless i am back to square one. You have a spare CPU you can try out. Maybe the RAM is not compatible with that MB. This is a tough one. Now the RAM, i know the ram works with it because ive checked the manual and the ram is the right voltage and the right timings. The only thing left could be the BIOS version and the Processor are not playing nice. But is going to be kind of hard to try a different BIOS when i dont have another CPU to through in there so i can put a different version on there. Thanks to all that replied. Thanks to all that replied. Good luck, bro. Its easy! Sign in here. For an optimized and safer browsing Please consider upgrading to a more modern browser. Just get a continuous beep. Tried 3 of the 8 new motherboards not installed in chassis with 3 new sets of RAM tried single sticks also and 2 of the 8 new CPUs. All testing was with one PSU. Works fine when I go back to all original components, also with new CPU Cooler. Original components are Case ABMX.com 1U short depth chassis Motherboard Supermicro PDSBMLN2 CPU Intel XEON 3060 RAM 2ea. Any thoughts or suggestions Those boards require it. They also require a 420 watt unit.

I think I forgot to mention that these original components will be used with the new components A continuous beep means an overheating issue. Click to expand. I thought it could possibly be the BIOS since I came across this in the Supermicro FAQs Yes, provided you have the latest BIOS. I thought it could possibly be the BIOS since I came across this in the Supermicro FAQs Click to expand. Do have any spare DDR3 memory other than the Muskin you could try Do have any spare DDR3 memory other than the Muskin you could try. Click to expand. Also, I might have been partially braindead when typing the original post, it isnt a continuous long beep. Its continuous beeping, not in any of the counts shown in the manual for error beep codes. I have never ran into a DOA SuperMicro, not that it is impossible. ASUS P5BVC LGA 775 Newegg.com ASUS P5BVC LGA 775 Intel 3200 ATX Intel Xeon Server Motherboard That ASUS board looks nice, but I had been directed to look for a board with onboard video that has full HD capability, thus the X4500HD video chipset. Unless the X4500 can do full HD playback also. Thanks again, Ill post here with the results if I can get the replacement RAM. That ASUS board looks nice, but I had been directed to look for a board with onboard video that has full HD capability, thus the X4500HD video chipset. Thanks again, Ill post here with the results if I can get the replacement RAM. Click to expand. Order up one Kingston module and test it. Have you tried just one Mushkin stick Here is a link to the spec sheet of the RAM It is 1.5V RAM also, the obvious difference that I can see is that this RAM has a 10600 bandwidth vs the 10666 of the

Mushkin. The Kingston RAM I was about to buy is PC310600. Would that be the cause of the motherboard rejecting the Mushkin. Edit PC310600 is on the label sticker on the RAM stick I pulled, I dont see that listed in the datasheet. Here is a link to the spec sheet of the RAM It is 1.

5V RAM also, the obvious difference that I can see is that this RAM has a 10600 bandwidth vs the 10666 of the Mushkin. Edit PC310600 is on the label sticker on the RAM stick I pulled, I dont see that listed in the datasheet. Click to expand. They could be all be bad, seen stranger things. I would only use it if I had some laying around I do and the boards QVL has it listed. Please login using the form on the right. Not our member yet What are you waiting for Register I have been able to do this 1 movie at a time, but I am not sure how to configure mediastream update all my movies to my library at once or at least to queue them up so that I dont have to go to each file and set content for each one. I have read the wiki which says to go the file list in the video section and use the context menu to set the content, however after I do this it still only shows the files that I manually set the content for. I would like to just be able to set the content for the entire folder and have it update each file for me but I cant seem to figure out what I am doing wrong. Another question I have is, if for instance I used a 3rd party scraper Media Companion that is configured to work in unison with xbmc that creates nfo files with all the IMDB information, how do I get xbmc to recognize the files. The wiki mentions the nfo files but I cant seem to find where in the wiki it explains how to configure xbmc to recognize them. What content options did you select. You have to set contents correctly for XBMC to pick up the nfo files. Do not email XBMC Team members directly asking for support. For troubleshooting and bug reporting please make sure you read this first. I have a media server in my office, and am building a small machine to put by my tv that will stream the videos from the server. The way I understand it, you want the following files stupidmovie.avi stupidmovie.nfo stupidmoviefanart.jpg stupidmovie.

tbh please correct me if Im wrong or missing something Is it best for me to leave all of those on the server, or should I be moving everything but the .avi over to the machine by my tv making sure that the nfo has the proper path to where on the network the actual video file is, of course The machine by my TV Intel BOXDG45ID 1GB DDR2 ram will be upgrading to 2GB soon 2GHz dual core Celeron And it will be running XBMC Live off of an 8GB USB memory stick. Do not email XBMC Team members directly asking for support. For troubleshooting and bug reporting please make sure you read this first. Once those movies have all been imported into xbmc with or without aeon stark and I switch to library mode, it should work exactly the same as it works now with no nfo files and all of my movies lumped into one directory I am aware that you were likely thinking that I should have been able to find this information with a forum search. I would just like to assure that I did indeed try that first but could not find the clear answers you have given me. Thanks again. Kodi is available for multiple operating systems and hardware platforms, featuring a 10foot user interface for use with televisions and remote controls. It allows users to play and view most videos, music, podcasts, and other digital media files from local and network storage media and the internet. Click the Edit link to modify or delete it, or start a new post. If you like, use this post to tell readers why you started this blog and what you plan to do with it. To find out more, including how to control cookies, see here. It got mothballed when I got tired of the heat it produced and I slowly switched to my laptop. Im asking here because I intend to replace the video card soon, and I cant seem to find any kind of a SETI GPU performance chart that, and maybe I can get some GPU thermal recommendations while Im here.

The goal is to run Star Trek Online as well as possible at 1080p, when not doing that run SETI as well as possible, and when doing neither produce as little heat as possible. The motherboard BOXDG45ID and case XQPACK2 are microATX, so I prefer a smaller board that doesnt have a very heavy heatsink for portability. Noise, especially at idle, will be a big consideration as this will reside in my bedroom when not at LAN parties. I realize some of these are conflicting priorities, but Im

sure some of you must have tips about what can be achieved with what. Thanks, Dan Since your goal is SETI, you'll want nvidia. Given your budget, try craigslist maybe for used to get more bang for the buck of course, buyer beware again, whatever you select, look up the mfg specs to ensure length doesn't exceed your case. Probably a GTX260 or 275. But there are utilities to throttle the GPU perf thus the temp and fan noise, etc. When Seti and its screen saver are off, it won't hit the GPU, or you can just specify nonGPU use for certain hours. The power supply fan is load controlled, and the rest are thermally controlled, so hopefully I'm fine. I'm considering this GTS 250 Gigabyte GVN2501GI . It has the power I want, good reviews, no mention of excessive noise or heat, only 1 bracket, and the cooler looks very Star Trek. Last modified 6 Mar 2010, 12:58:59 UTC Meooooooooooooooooow. I agree, but at this time, good luck finding them new, it seems that right now, their high end cards are becoming in short supply, so of course, their prices are rising. Started with the high end ones, and has moved down to the midhigher end like the 260SC. I have been having a discussion with my vendor about the 260s I ordered on the 23rd that I have yet to see, and have been told this time that they are now on backorder till the 16. This after I paid for them in full back on the 23rd. So, if you are ordering them, be sure they physically have them in stock.

Oh, and one other thing I found out when I looked into their warranty, it says specifically that it is void if purchased 2nd hand or thru an auction site, so unless you get it very reasonably priced, and don't care about the warranty, you might want to keep it in mind. This allows you to snooze the GPU and get your game on. I've noticed glitchy gameplay when my GPU was crunching. So, I'd advise against crunching and gaming at the same time. In a rich man's house there is no place to spit but his face. Diogenes Of Sinope Cancelled order with other co, and were same price! If you're looking for one in the near future, I'd suggest heading over there to order one before they're gone, since it seems almost no one else has any that I could find, esp at that price. If you get them, remember to register them within 30 days, to get the lifetime warranty. Here's the spec comparison I tried to put them side by side but the site apparently removes excess spaces. Not sure of the support or if extras like EVGA's Precision are available with BFG, are they comparable. It's in stock, too. Join the PACK! Here's the spec comparison I tried to put them side by side but the site apparently removes excess spaces. Not sure of the support or if extras like EVGA's Precision are available with BFG, are they comparable. I decided not to buy EVGA anymore because of a GTX 260 that only lasted a couple days before it had errors on all CUDA work. It's in my son's computer now, he's a big gamer and it works fine playing games. Then I had an EVGA 9800GT die on me, same thing. Just bad luck maybe. Not sure but with two dead cards I decided to go with anything different. Bought one BFG GTS 250, still working great, Although I need to up the fan speed to 80% because it wouldn't go above 40% by itself and was overheating. Bought another with the same problem easily fixed by manually setting the fan higher. My latest card I bought this past Christmas Had to find the box it came in to figure out what it was.
